Security alert and Gatekeeper

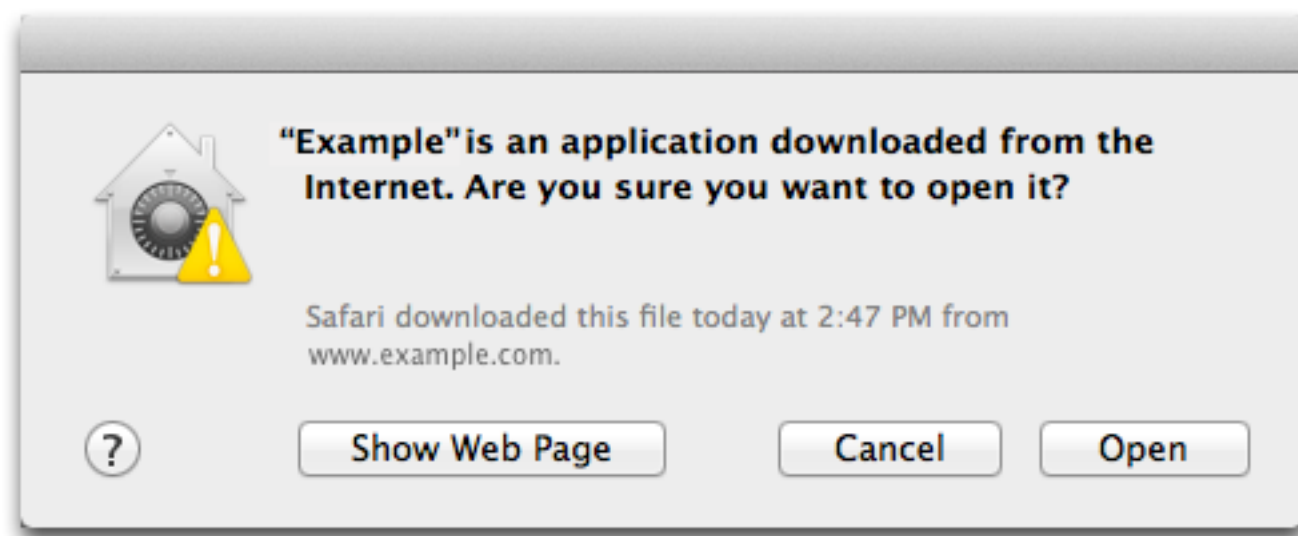

In this document I will explain what is Apple Gatekeeper and how to deal with it keeping safe your Mac. File received via an official FAO source (such as ext-ftp.fao.org) should be considered safe.

RuralInvest for Mac

SECURITY ALERT AND GATEKEEPER

How to protect your Mac

When you open a file downloaded from the Internet with a file quarantine-aware applications, or from external sources (such as email attachments), OS X warns you where the file came from. You receive an alert asking, "Are you sure you want to open it?" You should click Cancel if you have any doubts about its safety.

File received via an official FAO source (such as ext-ftp.fao.org) should be considered safe.

Gatekeeper

With Lion (OS X 10.7) Apple introduced a new feature, "Gatekeeper", to help protect Mac computers from malware and misbehaving apps downloaded from the Internet.

Gatekeeper gives you more control over what you install according to how much you trust the source.

If you see any of the two messages (as shown in images on following page)

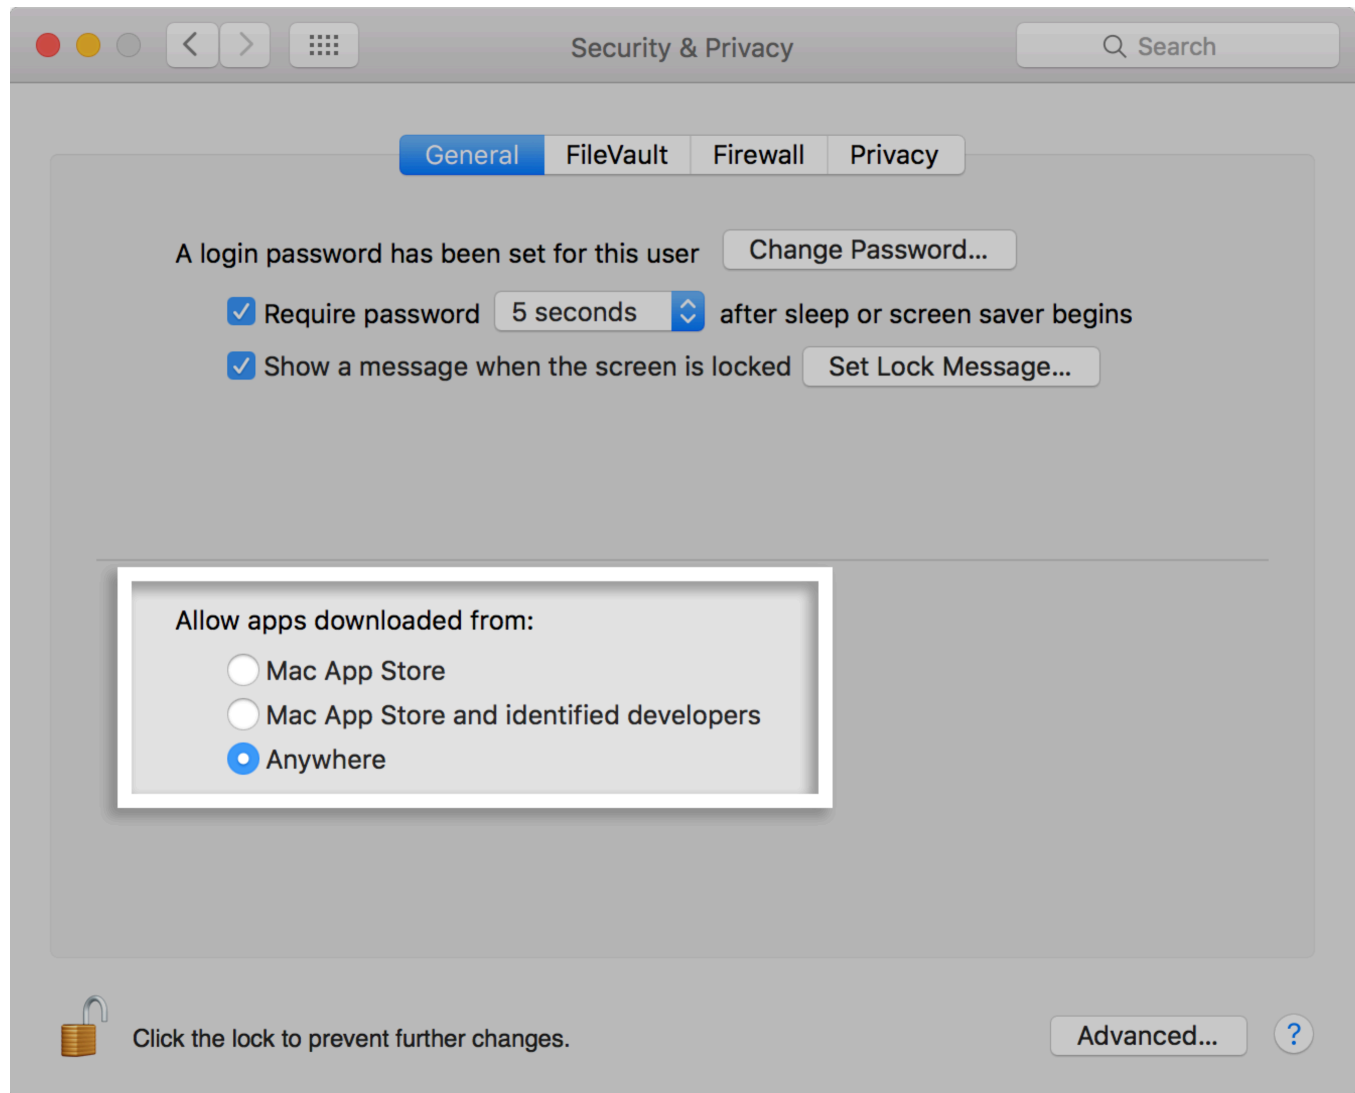

- "Installer" can't be opened because it was not downloaded from the Mac App Store
- "Installer" can't be opened because it is from an unidentified developer

You will have to change the configuration of your Gatekeep to install RuralInvest for Mac.

Temporarily change Gatekeep configuration

To install RuralInvest for Mac you can temporarily change Gatekeeper options, found in **Apple menu > System Preferences... > Security & Privacy > General tab** under the header "Allow applications downloaded from:" selecting "Anywhere" as shown in the image below.

And restore your previous configuration once you finished installing RuralInvest.
