## SECURITY ALERT AND GATEKEEPER

### How to protect your Mac

When you open a file downloaded from the Internet with a file quarantine-aware applications, or from external sources (such as email attachments), OS X warns you where the file came from. You receive an alert asking, "Are you sure you want to open it?" You should click Cancel if you have any doubts about its safety.

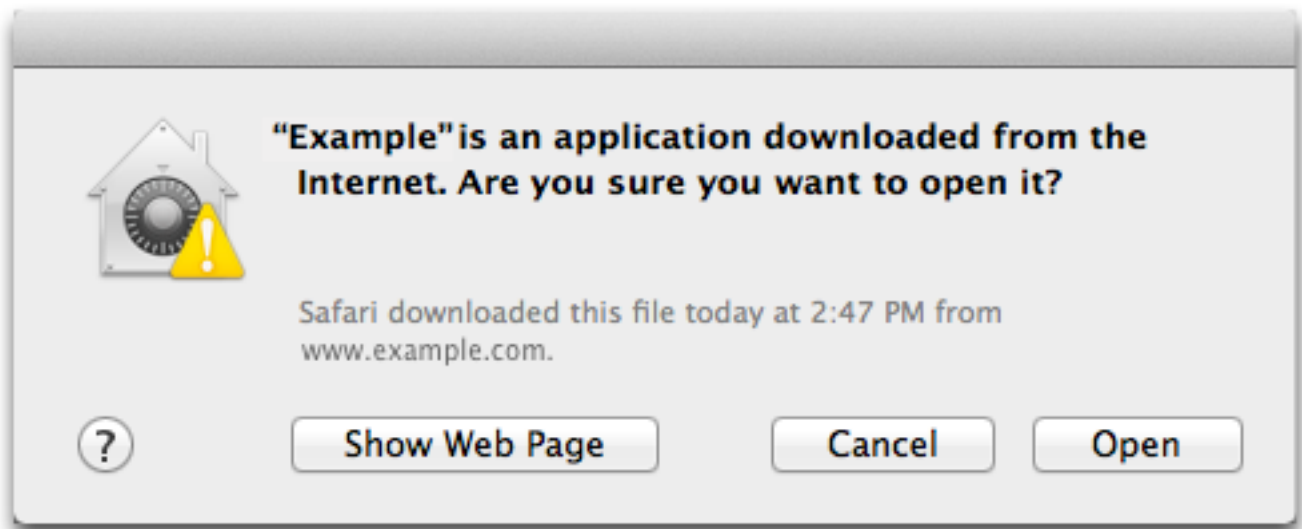

Figure 1

### Gatekeeper

With Lion (OS X 10.7) Apple introduced a new feature, "Gatekeeper", to help protect Mac computers from malware and misbehaving apps downloaded from the Internet.

Gatekeeper gives you more control over what you install according to how much you trust the source.

If you see any of the two messages

- “Installer” can’t be opened because it was not downloaded from the Mac App Store (Fig. 2)
- “Installer” can’t be opened because it is from an unidentified developer (Fig. 3)

Figure 2

You will have to change the configuration of your Gatekeeper to install RuralInvest for Mac.

### Temporarily change Gatekeeper configuration

To install RuralInvest for Mac you can temporarily change Gatekeeper options, found in **Apple menu > System Preferences... > Security & Privacy > General tab** under the header "Allow applications downloaded from:" selecting "Anywhere" as shown in the image below.

And restore your previous configuration once you have finished installing RuralInvest.
